

Advance 5000™

Description

Give your machines a voice with the EASITRAX® Advance 5000™ telemeter. The A5K is a scalable, device that gives operators a choice for cashless connectivity. Essential for credit card processing and ePayment, it maximizes options and increase sales. Modular components and a friendly user interface make upgrades and diagnostics seamless. When paired with one of our cashless bezels, you can offer your customers a new experience for payment options.

The Advance 5000 is the CPI hardware solution for full online telemetry, that works offline too. For many machines, operators can easily add a communication module to enable remote machine monitoring. This solution gives you a up-to-date picture of how to schedule your routes and when to visit your machines.

It also works as a communication platform for machine telemetry with MEI EASITRAX Advance. Dual IP capabilities (access point network) allow both cashless and telemetry communications to be directed independently from the Advance 5000, providing an additional layer of data security.

Drive telemetry and cashless solutions to give your machines a presence at the point of sale with Advance 5000.
